E-learning course developed for a financial institution

E-learning - training program for an oil and gas company

Medical interactive Ebook for a University

UI/UX Design for an E-learning course developed for an Airline

UI/UX Design for an AR educational app for kids - Digital content company

Interactive Learning Object (OVA) for a University

E-learning course developed for a financial institution

This e-learning program inspired by the world of superheroes, where each employee becomes the protagonist of a mission: to save the world from “infinite selfishness.” Through a playful and immersive narrative, the course transforms key organizational culture concepts into meaningful challenges and decisions, promoting empathy, teamwork, and best practices across the company.

Client: Financiera Comultrasan

E-learning - training program for an oil and gas company

The course was designed to align with the company's branding while introducing a fresh, modern aesthetic to enhance engagement. I used a clean, structured layout combined with infographics, icons, and motion graphics to support learning objectives and maintain user attention.

Client: **ECOPETROL**

Medical interactive Ebook for a University

This e-book was created as part of a university initiative to support patient education and promote preventive healthcare about diabetes and critical limb ischemia. The content is structured to be accessible, informative, and visually engaging, combining clear medical explanations with interactive content such as videos, info-graphics and illustrations.

Client: UNAB University

UI/UX Design for an E-learning course developed for an Airline

To make complex cybersecurity concepts more engaging and memorable, the course was built around a creative space travel metaphor. Learners embarked on a virtual mission through different planets, each representing a specific type of cyber threat, such as phishing, malware, social engineering, and data leaks.

Client:Avianca

UI/UX Design for an AR Educational App for Kids – Digital Content Company

This project involved the design and development of a multi-functional educational mobile application using augmented reality (AR), aimed at children across different age groups.

I collaborated with content developers, illustrators, and AR programmers to craft a cohesive and accessible digital experience. Ensuring that the app was intuitive, playful, and age-appropriate.

Client: Arteyanimacion

Interactive Learning Object (OVA) for a University

I led the UI/UX design and multimedia production, crafting the entire user experience—from structure and visual style to interactive elements and navigation flow. Working closely with academic experts, I translated complex theoretical content into a clear, dynamic, and intuitive format for students.

The OVA presents the concept of fallacies through definitions, real-life examples, interactive exercises, and self-assessment tools to reinforce learning.

Client: UIS University

Thank-
you.

for watching.
